A study conducted at the University of Houston (UH) and Ohio State University (OSU) found that, in general, states with higher income tax rates were less likely to regulate the oil and gas industry. The study, the largest of its kind to date, was published in Energy Economics, an Energy Journal in cooperation with the National Bureau of Economic Research. "Much has been written about how income taxes discourage investment and innovation. But income taxes are but one of many ways in which state and local governments influence the private sector. This study shows that income taxes have a substantial effect on the rate of new oil and gas development," said Steven N. Ross, lead author of the study and assistant professor of economics at UH. The study used U.S. Census Bureau data to investigate the relationship between state and local income taxes and the estimated value of new natural gas and oil development from 2002-08. To estimate the value of new oil and gas development, the study used a model that uses information about the quality of the resource, drilling costs and estimated well productivity. The study found that for every one percentage point increase in state and local income tax rates, the rate of new oil and gas development declines by 1.5 to 2.6 percent. A finding that is quite comparable to previous studies looking at the relationship between income tax rates and federal R&D expenditures. More specifically, the study found that in states with higher income taxes, the estimated well productivity of new oil and gas wells was 25 percent less than in states with lower tax rates. It also found that well productivity declined by an average of 6.5 percent in the 10 states with the highest income tax rates compared to 1.9 percent in the 10 states with the lowest income tax rates. Interestingly, the study found that the relationship between income tax rates and well productivity was stronger than the relationship between income tax rates and federal R&D expenditures. "The implications of this study are very significant. The average well productivity is a major driver of profitability, which drives total corporate investment," said Ross. "By restricting the total amount of corporate investment, the state income tax becomes an important regulator of new oil 82157476af
